

A Lifetime of Music

MEMO: To All Bryston Customers

SUBJECT: Distributor Feedback - MINI A SPEAKER

Hello James,

The Bryston Model A Mini goes in the Bryston philosophy - the performance first. The speaker looks rather ordinary. It does not come with a grille* and you can see the hex screws protruding from the front panel (larger Bryston speakers look much nicer, though, especially in wood veneer).

But once you hear the speaker, you forget about this quickly. Mini A needs about 20 - 30 hours of burn-in. Then it presents an unbelievably clean and balanced sound. The bass range is definitely present and subjectively goes well below the 60 Hz specification stated. The range is very clean with no bass bloom or bass peaks, which are often used in small speakers to beef up the bass (at a cost of distortion and unevenness).

The midrange also has a surprisingly low distortion for this price range. In comparison with twice as expensive loudspeaker from a well respected manufacturer, the voices and instruments sounded clearly more natural and closer to

their real sound.

The highs benefit from the use of the new version of Bryston tweeter, which could be found even in the top-of-the-range Bryston Model T. The spatial presentation of instrument images is great. The subjective sensitivity of the speaker is relatively low but it can play at quite high volume in a small room. The dynamic capability also goes beyond its price range.

In conclusion – again in the range of small bookshelf speakers, Bryston is again very successful with this Mini A loudspeaker!
